

Weatherproofing

To ensure our system remains weatherproof, we use multiple protectants to prevent any damage from environmental factors. As shown above, between each panel we use translucent UV protected interlocking channels to protect our systems from water and wind. Prior to installing our track we wrap the opening with Protecto Wrap, which meets ASTM 2112, and use Sikaflex, the industry's best sealant, to fill any remaining gaps. Additionally, depending on one's exposure, we also drill weep holes at the lowest point of our track to ensure that any water will drain out. Please refer to our *Drainage* page for more information.

Angles We Can Seal
